

# Easy Air A signify Lighting Control System

Easy Air from Philips is an innovative and cost effective control system allowing control over individual luminaires or groups of luminaires via wireless sensors.

The system is based on movement and light detectors that are built into the luminaire and are commanded by app through a local control system from any tablet or smartphone.

The wireless sensors are designed to manage energy savings and advanced lighting scenarios at the users' convenience.

The system is suitable for a variety of work spaces such as conference rooms, offices, corridors, and more, and allows a large selection of lighting scenarios according to the level of presence in the room and the level of daylight.

A control connection is all that is necessary to control a group of luminaires via a single sensor. The sensor is activated by a Phillips Xitanium SR driver.

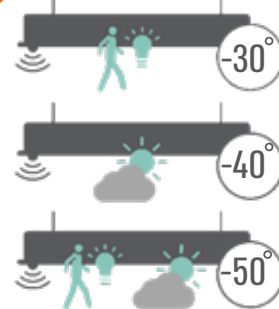

Wireless sensor controlling the luminaires

Easy installation with control infrastructure only

Determining the energy savings scenarios

Control the scenarios with any Android device
